### Definitions

1) *Standard Deviation: A statistical measure of the volatility of a stock's price.*

*Stocks with higher volatility are considered riskier investments but carry the potential for higher returns. Consequently, risk-tolerant investors often favor securities with high historical volatility.*

2) *Tracking Error: A measure of the divergence between the return of the Fund and the return of its Benchmark Index. A lower tracking error indicates that the Fund is closely replicating the performance of the benchmark index.*

3) *ROE (%): ROE stands for Return on Equity. It indicates the efficiency of a business's use of equity, demonstrated by how much profit after tax is generated by one unit of equity capital. The higher this metric, the better. This figure will vary depending on the industry and the financial leverage ratio (A/E) used by the enterprise. Investors should typically seek companies with an ROE above the industry average.*

4) *Price-to-Earnings Ratio (P/E): A valuation metric indicating the amount an investor is willing to pay for one unit of a company's Net Income (Earnings Per Share - EPS). While a P/E ratio below 8-10x is often considered a reasonable valuation, companies with high projected earnings growth may command a P/E higher than the industry average. The Portfolio P/E is calculated as the weighted average of the individual stocks within the portfolio.*

5) *Price-to-Book Ratio (P/B): A valuation metric comparing a company's market price to its book value. A P/B ratio below 1.0x indicates the stock is trading below its book value, often seen as an attractive value investment; however, companies with strong growth prospects may trade at a P/B above the industry average. The Portfolio P/B is calculated using the weighted average method. Note: Calculations represent the majority of the portfolio and may exclude outliers to ensure representative data*

6) *Volatility Level: A relative visual representation of the uncertainty and potential variance in the Fund Certificate's value. It reflects the probability of value fluctuation (depreciation or appreciation) driven by market dynamics, corporate financial health, and macroeconomic/political factors. The Fund's portfolio is diversified to mitigate risk and enhance stability amidst market changes. Investors should carefully review fund documentation and consider their personal risk appetite before making investment decisions.*
