

TECHCOM BALANCED FLEXI FUND

FEBRUARY, 2026

The Techcom Balanced Flexi Fund (TCFF) adopts a balanced approach that allocates capital between high-quality stocks and fixed-income instruments. This strategy is designed to capture the upside potential of Vietnam's equity market while utilizing the stability of corporate bonds to mitigate downside volatility. TCFF is an ideal solution for investors seeking growth with a more moderated risk profile than pure equity funds.

The fund targets a long-term return 1.5 times the average 12-month savings interest rate, realized in accordance with the holding period.

TECHCOM BALANCED FLEXI FUND

FEBRUARY, 2026

Metrics Definitions

- 1) *Sharpe ratio: an indicator that measures the return per unit of risk of an investment portfolio. A higher value for this indicator is generally better.*
- 2) *Standard Deviation: an indicator that measures the level of price volatility of a fund certificate. Fund certificate with high volatility are considered high-risk investments but can also potentially yield high returns. Therefore, risk-seeking investors often invest in highly volatile fund certificates.*
- 3) *Alpha: a risk-adjusted measurement of the portfolio's return compared to the market portfolio (VN-Index). Alpha > 0 means the portfolio manager performed better than the reasonable market expectation, while Alpha < 0 indicates that the portfolio manager is underperforming compared to simply holding the market portfolio and adjustments should be made to achieve a better rate of return.*
- 4) *Beta: a coefficient that measures the volatility of a stock relative to the value of the market portfolio (VN-Index).
+ The absolute value of Beta indicates the degree of volatility relative to the market. For example: The absolute value of Beta > 1 means the stock price is more volatile than the market, while the Beta's absolute value < 1 means the stock price is less volatile than the market.
+ Beta > 0 means the stock price moves in the same direction as the market, Beta < 0 means the stock price moves in the opposite direction as the market. A portfolio's Beta is determined using the weighted average method based on the proportion of each stock in the portfolio. For instance, in a 3-stock portfolio with weights of 20%, 30%, and 50%, and corresponding betas of 0.8, 1.1, and 1.2, the portfolio beta would be: $0.8 * 20\% + 1.1 * 30\% + 1.2 * 50\% = 1.09$.*
- 5) *ROE (%): ROE is an abbreviation for Return on Equity. ROE measures the efficiency with which a company uses its shareholders' equity, showing how much after-tax profit are generated per one unit of equity. A higher value for this indicator is better. This figure will vary by industry and the financial leverage (A/E) used by the company. When seeking opportunities, investors should look for companies with an ROE higher than the industry average.*
- 6) *P/E: is a valuation metric that indicates how much an investor is willing to pay for a company's stock price for each net profit (EPS) unit the company earns. A stock with a P/E < 8-10 is often considered reasonable, but for a company with high expected EPS growth in the future, a value higher than the industry average may be acceptable. The portfolio's P/E is determined using the weighted average method based on the proportion of each stock in the portfolio.*
- 7) *P/B: a valuation metric that indicates how much money an investor is willing to pay for a company's stock price for each unit of the company's book value. A P/B < 1 suggests the stock price is trading below the company's book value, which may be considered attractive for investment. However, if the company has good growth prospects, the P/B may be higher than the industry average. The portfolio's P/B is determined using the weighted average method based on the proportion of each stock in the portfolio. The calculations above represent the majority of the portfolio and may exclude certain outliers that do not fully reflect the representative values within the portfolio.*
- 8) *Volatility Level: a relative visual representation of the degree of uncertainty and change that can occur in the value of the Fund Certificates. It reflects the possibility that the fund certificates may decrease or increase in value in the future due to various factors such as market fluctuations, the financial situation of invested companies, politics, economics, etc. The Fund's investment portfolio is diversified, helping to spread risk and make the investment portfolio more stable under changing market conditions. Investors should carefully review the information regarding investment funds and consider their risk aversion to make appropriate investment decisions.*
